

## Low technology value-adding systems

---

Adding value and shelf life to agricultural produce that would otherwise largely go to waste is an excellent way to promote poverty relief and self-sustainability. Dryers for Africa supplies a range of processing equipment suitable for smaller farmers and community upliftment projects. This equipment specifically uses low technology systems, but it does not compromise on quality.

The range includes:

- Fruit, vegetable, herb and nut drying systems.
- Small-scale fruit/vegetable pulping and juicing.
- Jam and jelly production.
- Energy generation in drawing from local availability – electricity, gas, diesel, biomass fuels, or a combination. Solar dehydrators are also available
